Name: _____

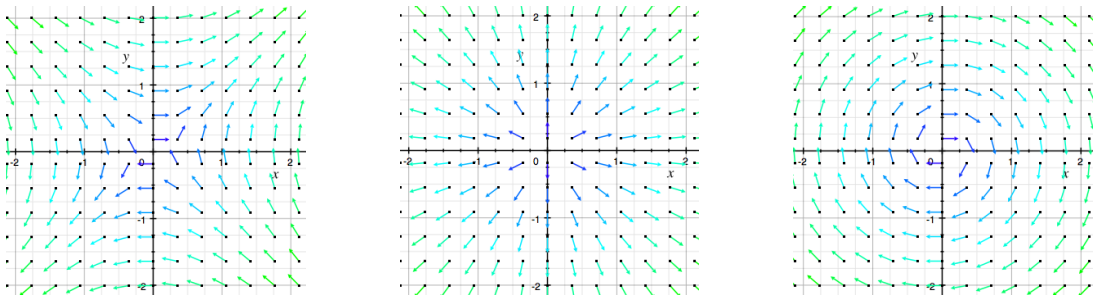
Time (circle one): 12:10 - 1:00 3:10 - 4:00

Please use extra paper as necessary. For each part, partial credit will be assigned based on correct work (you do need to show some work, enough so that I know how you solved the problem). Please simplify and $\boxed{\textit{box}}$ *your answers.*

For this quiz, consider the vector field:

$$\vec{v}(x, y) = y\vec{\imath} - x\vec{\jmath}$$

a. (1 pt) Which of the following is a graph of $\vec{v}$?



(Note: My graphing calculator normalizes each vector in a vector field to a unit vector, and displays the magnitude as a color. But this is a black-and-white printer. So you'll have to make your pick based only on the direction of the vectors.)

b. (2 pt) Is there a function $F(x, y)$ so that $\vec{v}(x, y) = \vec{\nabla} F$? If so, find such a function. If not, explain why not.

c. (4 pt) Given real numbers a, b, evaluate $\int_\gamma \vec{v} \cdot d\vec{r}$ along the following paths:

- $\vec{r}(t) = (at, 0)$ for t ranging from 0 to 1.

- $\vec{r}(t) = (0, b - bt)$ for t ranging from 0 to 1.

- $\vec{r}(t) = (a - at, bt)$ for t ranging from 0 to 1.

d. (3 pt) What is the relationship between the sum of the three answers in part c. and the area of the triangle with corners $(0, 0)$, $(a, 0)$, and $(0, b)$? Use Green's Theorem to prove that this relationship holds for path integrals around the boundary of any region. (Hint: This is a good chance to check your answers to part c., if Green's theorem suggests a different relationship between the area of a region and the integral of $\vec{v}$ around the boundary of that region.)
